Summary

Node.js Developer with 6+ years of commercial backend development experience. Designing and building scalable backend systems for FinTech, Healthcare, AI, E-commerce, Education and SaaS products.

Background in building and integrating APIs, payment integrations, AI-powered products, event-driven architectures, data pipelines, analytics, and multi-tenant platforms.

Last key achievements:

- Designed and delivered backend architectures for 10+ projects.
- Built reusable NestJS backend starter template adopted across multiple company projects.
- Developed **FinTech** platform supporting advisor-client portfolio management and **KYC/KYB** workflows.
- Built analytical data pipelines to **ClickHouse** using PeerDB.
- Implemented **AI-powered search** for marketplace mobile application.
- Designed scalable multi-channel notifications infrastructure supporting localization and tenant requirements.

Main Technologies

Backend: Node.js, TypeScript, NestJS, Fastify.

Databases: PostgreSQL, MySQL, MongoDB, SQLite, ClickHouse.

ORM: TypeORM, Drizzle, Sequelize, Knex.

Async Processing: RabbitMQ, Redis, NATS, Bull.

Infrastructure: AWS, Docker, Terraform, Ansible, GitHub Actions.

Observability: OpenTelemetry, PostHog.

Frontend: React.js, Next.js, Vue.js, react-native.

CMS: Strapi, Directus, Payload, Wordpress.

You can find my hobby projects and mobile applications on my [website](#).

Experience

Ein-des-ein

Back-end Node.js Developer | 03/2021 – Present

Participated in project estimation, technical planning, architecture discussions, and code reviews.

Owned backend database design and third-party integrations, ensuring maintainability and long-term scalability of solutions.

Initiated and drove adoption of a reusable **backend boilerplate template**, improving development consistency, accelerating project delivery, and helping onboard new team members more efficiently.

FinTech Investment Platform

- Implemented B2B advisor functionality scope allowing advisors to manage client portfolios and create hierarchical investment models with customizable inheritance rules.
- Implemented **KYB** verification flow via WebID provider.
- Refactored **KYC** module and integrated Fourthline verification provider.
- Designed and implemented scalable notification infrastructure supporting email, push notifications, localization, scheduling, and tenant-specific customization requirements.
- Built analytical data pipelines using PeerDB and **ClickHouse** for business analytics dashboards.

Car Dealer App (AI features)

- Developed backend services for vehicle listings, dealerships, geolocation search, chat functionality, and advanced filtering.
- Implemented **AI-powered search** that converts natural language user requests into structured search filters understood by the backend.

Education Platform

- Designed backend architecture and database schema from scratch.
- Implemented **Stripe** payments for courses, memberships, and event tickets.
- Built QR-based lesson attendance tracking.
- Developed study progress calculation logic with reward and discount rules.

Result: platform supports paid education flows, event monetization, and automated progress tracking.

Hazard Reporting Platform (Microservices Architecture)

- Designed and developed a microservices architecture consisting of three independent services.
- Google Maps API + PostGIS for geospatial data and real-time maps.
- Redis queues for async processing.
- Generation of PDF hazard reports.

Online Medical Platform

- Integrated **PayPal** payments and pharmacy stock ordering.
- Integrated **Google Meet API** for secure video consultations.
- Built complex scheduling appointment system (recurring slots, exceptions, day-offs).
- Implemented prescription workflow with multi-doctor approval.

Complexity: healthcare domain, strict permissions, and non-trivial scheduling logic.

Anti-Snore Mobile App

- Refactored **critical** core logic causing incorrect exercise generation.
- Replaced Redis-based solution with optimized SQL queries.
- Reduced infrastructure costs and simplified data consistency.

Result: improved stability and reduced operational costs.

Social network with streaming for artists

- Built a **social network platform** with an admin panel for artists to schedule and host public or private paid online events for users.
- Designed complex **SQL queries** for calendar logic with recurring workday slots.
- Integrated **FFmpeg for video processing** (cropping, generating short clips).
- Implemented **real-time chats**.
- Used **AWS S3** to store full stream video recordings.
- **Developed a notification module (email, push notifications) triggered by various events.**

ITTEAM

Back-end Node.js developer | 08/2020 – 01/2021

- System and database architecture development.
- Developed REST APIs using NestJS., **chat microservice** using **NATS** transport.
- Built CI/CD pipelines and Docker-based deployment workflows.
- Integrated Firebase services for user authentication, push notifications.

Result: API for the social-event mobile app, which shows events around you.

SPDeveloper, office

Full stack developer | 05/2019 – 02/2020

- Built REST APIs on Node.js.
- Implemented frontend features using Vue.js.

FlyFox, remote

Wordpress & Front-end developer | 08/2017 – 04/2019

- Developed and maintained WordPress-based websites.

Education

Software Development - 2022 – 2023

Master of Science in Software Development
Ivano-Frankivsk National Technical University of Oil and Gas

Software Development - 2019 – 2022

Bachelor of Science in Software Development
Ivano-Frankivsk National Technical University of Oil and Gas

Software Development - 2015 – 2019

Junior Specialist in Software Development
Ivano-Frankivsk National College of Electronic Devices by Technical University of Oil and Gas
